

Running Your First Java Program: Hello, World!

Running a basic Java program involves three distinct steps: **writing the code**, **compiling it**, and **running the compiled class**.

1. Write the Java Source Code

Use any text editor (like VS Code, Sublime Text, or Notepad) to create the source file.

Code to Write:

```
public class HelloWorld {  
    public static void main(String[] args) {  
        System.out.println("Hello, World!");  
    }  
}
```

Save: Save the file as **HelloWorld.java**. The file name **must** match the class name exactly.

2. Compile the Code

Java uses a compiler (javac) to translate your source code (.java) into bytecode (.class).

1. **Open your terminal** or command prompt.
2. **Navigate** to the directory where you saved HelloWorld.java.
3. **Run the Java Compiler:**
`javac HelloWorld.java`

*If successful, a new file named **HelloWorld.class** will appear in the same directory.*

3. Run the Program

Execute the compiled bytecode using the Java Launcher (java).

1. **Use the terminal** (still in the same directory).
2. **Execute the class** (do **not** include the .class extension):
`java HelloWorld`

✓ Output

Your terminal will display the result:

Hello, World!
